Advance Guardrail System

Layher's Advance Guardrail System is a really effective way of preventing scaffolders falling during erection and dismantling of scaffolds. The Advance Guardrail System enables a prefixed guardrail at the working height before the scaffolder enters the working platform to install permanent guardrails.

The system is lightweight, easily operated by one person and works with any 48.3mm tube system. WorkSafe Victoria recently issued a Guidance Note for Fall Prevention for Scaffolders. It is the first authoritative source that we are aware of that recommends harnesses should not be used in the erection and dismantling of normal scaffolds. The Guidance Note recommends the use of the "Sequential Method", which has been endorsed in Europe on the recommendation of Layher. Layher's Advance Guardrails are particularly well suited for use in the sequential method of scaffold erection.
